

ABSTRACT OF THE DISCLOSURE

To create a screen and a calling program for each service component, and a screen sequencing program when a system for allowing an application developer to make confirmation through a dialogue with a screen as to how to select a combination of existing service components, each work and input/output data thereof are defined, correspondence of each work to service components available in the work is defined, and a flow among the works is defined. Based on such definitions, an input screen and an output screen are created for each work, and flow definition information of the works is converted into flow definition information of screens so as to create a screen sequencing program. The program is executed through a dialogue with the application developer in accordance with an input operation of the application developer. A system for allowing the developer to make confirmation through a dialogue is produced.
